

# Vapor Intrusion Coating System for Existing Structures

**Retro-Coat<sup>TM</sup>**  
Vapor Intrusion Coating

[www.landsciencetech.com](http://www.landsciencetech.com)

## Key Benefits

Eliminates  
Risk

Excellent  
Constructability

Highest Chemical  
Resistance on  
the Market

Competitively  
Priced

*Retro-Coat finishes to a high gloss, easy-to-clean surface that is impervious to vapor and moisture intrusion.*

## Product Description

The Retro-Coat™ Vapor Intrusion Coating System is a complete product line that consists of chemically resistant materials to properly protect existing structures from the threat of vapor intrusion without the need for additional concrete protection. Developed by the Research and Development team of Land Science®, the Retro-Coat system has been subjected to rigorous testing procedures to prove its ability to combat the most aggressive chemical vapors. The main component of the Retro-Coat system is the Retro-Coat coating which is a two part, odorless, no volatile organic compounds (VOCs), 100% solids coating.

Available in a variety of colors, Retro-Coat can be applied on damp as well as dry concrete,

concrete masonry units, tile, brick, and metal. For enhanced slip resistance, a suitable aggregate can be added. In addition, other additives or materials can be utilized to achieve a desired performance or aesthetic look.

## Typical Application

---

Retro-Coat is a suitable barrier to block contaminated vapors from entering existing structures. Particular uses include coating the horizontal surfaces of existing structures where contamination under, or adjacent to, a structure can potentially migrate inside the structure and create a vapor encroachment condition. This condition is most commonly found when the existing structure was operated as a dry cleaner, gas station, manufacturing facility, or located in close proximity to any structure where carcinogenic chemicals were utilized.

A typical application consists of a minimum 20 mil thick system and of two 10 mil coats of Retro-Coat at 160 square foot/gallon per coat and is recommended along with a 6 mil coat of Retro-Coat PRIMER. The typical 20 mil application can withstand forklift traffic, other machinery, and even act as secondary containment. However, if Retro-Coat is exposed to harsh conditions over a longer period of time and/or used for a unique application, please consult with a Land Science representative to discuss options and a recommended approach.

## Retro-Coat<sup>TM</sup>

---

Vapor Intrusion Coating

## Retro-Coat Advantages

---

- ✓ Our R&D team developed all of the Retro-Coat system components specifically for vapor intrusion protection in existing structures
- ✓ Resistant to both TCE and PCE
- ✓ A wearing surface, meaning no additional concrete protection is necessary
- ✓ No odor and fast cure time reduce building downtime
- ✓ Carpet, tile, linoleum or other floor coverings can be applied directly over Retro-Coat, if desired
- ✓ Eliminates the need to remove the existing slab and when combined with in situ treatment, lowers overall remediation cost
- ✓ Can increase the performance of an existing active sub-slab depressurization system
- ✓ Can aid in the retiring of existing active systems
- ✓ Available and installed by Land Science certified contractors

# Former Jazz Club Protected from Vapor Intrusion

## Challenge:

Renton, Washington is a bedroom community located just outside of downtown Seattle. As a suburb to downtown Seattle, Renton has seen tremendous growth over the last two decades as technology giants like Microsoft, Amazon, and Nintendo chose the area for their global headquarters. With commercial properties and home values ever increasing, developers are looking for new ways to restore brownfield sites quickly and effectively, to allow them to move forward with future development. In the case of this former popular jazz club in the historic section of downtown Renton, indoor air quality was impacted

by volatile organic compounds associated with dry cleaning solvents that had spread from a nearby dry cleaning operation.

In May, 2017, Maul Foster Alongi conducted an indoor air quality assessment at the Property after installation of Retro-Coat VI System. In order to obtain samples representative of indoor air conditions at the Property and to ensure that the same indoor air conditions existed during the previous indoor air quality assessment conducted by Maul Foster Alongi in January 2017.

## Results:

The objective of mitigating VI of VOCs into the building structure for future occupants at the property has been met by the installation of the Retro-Coat VI System. The Retro-Coat VI System provides a long-term solution to the property indoor air quality issues arising from the adjoining dry cleaners facility.

Laboratory analytical results for the indoor air quality assessment after installation of the Retro-Coat VI System indicated the following:

- The PCE concentration in the dining room area (JRIA-5 indoor air sample—5.1  $\mu\text{g}/\text{m}^3$ ) measured below the Department of Ecology Vapor Intrusion Indoor Air Method B cancer CUL of 9.6  $\mu\text{g}/\text{m}^3$  (DOE, 2016).
- Other VOCs associated with dry-cleaning solvents, including carbon tetrachloride, 2 butanone, toluene, and xylenes, were also detected below their respective DOE Vapor Intrusion Indoor Air Method B cancer CULs.

# Former Industrial Manufacturing Facility Reborn

## Challenge:

A former industrial manufacturing facility in Greenville, SC was purchased for redevelopment in 2017. Building improvements were planned to include a warehouse, offices, and self-storage units to serve a growing commercial area. Redevelopment plans included converting the industrial warehouse building into climate controlled self-storage units, and renovating the office into an apartment unit and office. Sub-slab soil gas samples detected various VOCs above the laboratory method detection limit. Bunnell

Lammons Engineering utilized the Environmental Protection Agency (EPA) Vapor Intrusion Screening Level (VISL) calculator to model potential indoor air concentrations of VOCs based on the sub-slab soil gas results. Based on EPA VISL calculations, two VOCs, chloroform and TCE, had estimated indoor air concentrations above their respective EPA Industrial/Commercial Risk Based Screening Level (RSL). The indoor air samples also had detections of TCE above the EPA Residential RSL.

## Results:

Incorporating the vapor mitigation technology into the anticipated renovations was both cost and time effective for the site owner. The combination of Vapor-Vent and Retro-Coat was determined as a mitigation technique to reduce the potential risk of harmful vapor intrusion in the new apartment and

office. Bunnell Lammons Engineering plans for two rounds of post-mitigation sampling. One was already performed in the summer of 2019 and one is planned in the winter between December 2019 and February 2020 to verify the effectiveness to the system.

# World Class Clients

---

Environmental consultants, engineers, and real estate professionals trust Land Science to produce results knowing our expertise and industry knowledge has been proven time and again at the job site. Our world class clients include leaders in the food, banking, government, and housing industries.
